SUMMARY

7+ year work experience, focus on inference optimization on NPU/GPU including model compression/compilation optimization/performance modeling...

EDUCATION

Ph.D. of Electronics Engineering 2013 - 2018
University of Chinese Academy of Sciences. Outstanding Graduates

Bachelor of Electronics Engineering 2009 - 2013
Southeast University.

PROFESSIONAL EXPERIENCE

Automotive Model Inference Optimization
AI Software Architect of Edge Computing Group Alibaba PTG 2024-12 – Present

Focused on inference acceleration and model optimization for in-vehicle AI workloads, targeting deployment on a custom GPGPU-based AI accelerator.

- **End-to-End Auto-Driving Model Inference Optimization**: Led the quantization and deployment of multiple end-to-end models on custom GPGPU architecture.
  - Supported models including **VAD**, **Uni-AD**, **BEVFormer**, and **DiffusionDrive** with 8-bit quantization and <1% open-loop accuracy drop.
- **Operator Optimization and Hardware Requirement Analysis**: Performed in-depth operator-level optimization and bottleneck analysis on custom GPGPU, driving hardware requirement definitions for next-generation edge SoC.
  - Developed optimized CUDA kernels for performance-critical ops including **DeformableAttention/GridSamp** reducing latency to ∼1/6 of MMCV baseline.
  - Conducted bottleneck analysis on latency-dominant operators (especially **Deformable Attention**) in **VAD-Base**. Derived the **double ALU** hardware requirement with quantitative performance gain estimation, and delivered to PPU team as edge SoC design input.
  - Analyzed hardware optimization options for **Flash Attention** during LLM **Prefill** stage. Quantitatively evaluated the performance benefit of **double SFU**, and delivered to PPU team as edge SoC design input.
  - Identified and fixed a traffic anomaly in the **FP8 GEMM** operator on the performance model, and completed the corresponding kernel modification.
  - Developed **INT4W16 GEMM** optimized kernel, enabling efficient mixed-precision inference for weight-only quantized models on custom GPGPU.
- **VLM/VLA Inference Optimization**: Worked on low-bit inference optimization and decoding acceleration for **Qwen-VL** and **Orion**.
  - **Qwen-VL** Quantization and Speculative Decoding:
    - Experimented with **AWQ**, **SmoothQuant**, **GPTQ**, and **SpinQuant** to quantize Qwen-VL to **FP4** (weights + activations). Achieved higher accuracy than the W4A16 baseline through FP4 quantization, while reducing **Prefill** latency by 50%.
    - Integrated **Eagle** speculative decoding, achieving up to ∼4.7× decoding speedup.

- **Orion** VLA model quantization:
  - Combined quantization technique (**Spin + Scale + SVD decomposition + Mixed precision**) to retain accuracy of FP4 model.
  - Achieved >15% latency reduction compared to FP8 baseline.
- Conducted joint software-hardware evaluation of low-bit formats like **Microscaling FP4** and **NVFP4** to guide quantization hardware roadmap.

- **Low-bit Quantization Research**: Conducted research on advanced quantization techniques for LLM weight compression, targeting higher compression ratios with minimal accuracy loss.
  - **RDQuant** – Rate-Distortion Optimal Mixed-Precision Quantization:
    - Proposed and developed a per-output-channel mixed-precision quantization framework based on **rate-distortion optimization**. Used Lagrangian relaxation to optimally allocate bit-widths (**NVFP4/FP**
    across channels under a given bit budget.
    - Integrated calibration-based layer importance weighting (Fisher information / gradient norms) and format-aware grouped GEMM inference via **vLLM Marlin** and **CUTLASS** kernels.
    - On **Qwen3-4B**, achieved lower perplexity than the BF16 baseline at only ∼5.3 bits/weight, outperforming uniform NVFP4 quantization.
  - **Entropy-Aware NVFP4 Quantization**:
    - Investigated entropy-based analysis of weight distributions to identify information-theoretic redundancy in NVFP4 quantization.
    - Developed an entropy-aware scaling strategy that adapts per-block quantization parameters based on weight distribution entropy, improving reconstruction quality for high-entropy (outlier-rich) channels while maintaining compression ratio.

- **Cross-Platform VLM Deployment and Benchmarking**: Performed architecture analysis, deployment, and cross-platform performance benchmarking of latest-generation VLMs across **NVIDIA Thor** and custom **PPU**-based edge SoC.
  - Analyzed the network architecture of **Qwen2.5-VL**, **Qwen3-VL**, and **Qwen3-Omni**, including vision encoder, cross-attention mechanism, and multimodal fusion pipeline.
  - Deployed and benchmarked the above models on both **Thor** (GPU) and **PPU** (custom accelerator) platforms. Conducted end-to-end latency profiling and operator-level bottleneck analysis across platforms.
  - Identified key performance bottlenecks in Prefill and Decode stages, comparing compute/memory utilization differences between Thor and PPU to guide platform selection and hardware co-optimization.

NPU Software Architecture Design
AI Software Architect, Movidius NPU Team Intel 2022-Q1 – 2024-Q4

Contributed to the co-design of software and hardware architecture across multiple generations of Intel's Movidius NPU product line, focusing on compiler prototyping, advanced compilation techniques, and hardware/software co-optimization.

- **Prototype Compiler Development**: Led the development of a prototype compiler to interface with backend hardware simulators for accurate and reliable model performance simulation.
  - **Hardware Change Validation**: Evaluated the software stack impact of proposed hardware changes for future NPU generations. Integrated with hardware simulators to test architectural trajectories and identify those with improved PPA.

- **KPI Definition and Bottleneck Analysis**: Defined key performance indicators using internal profiling toolsets. Analyzed performance bottlenecks in customer workloads (e.g., Microsoft, HP) to inform compiler feature planning and hardware evolution.
- **Model Coverage and Stability**: Achieved support for over 800 models with 90%+ coverage of Intel Open Model Zoo, ensuring broad compatibility and robustness.

- **Advanced Compilation Technique Development**: Explored cutting-edge compilation techniques to improve inference efficiency on NPUs. Collaborated with production compiler and DirectML teams to deliver transferable insights.
  - **LLM Performance Optimization**: Optimized LLM inference through mixed precision, FlashAttention, task pipelining, and memory-efficient FFN tiling.
  - **Tiling and Fusion**: Developed automatic layer fusion algorithms for cross-component execution. Implemented double buffering for conflict-free scheduling.
  - **Resource Allocation and Scheduling**: Designed algorithms for efficient compute/memory resource allocation with reduced spilling. Developed prefetch scheduling to overlap communication and computation.
  - **POC on Production Compiler**: Implemented and validated proposed techniques on the MLIR-based production compiler targeting real-world software and hardware stacks.
- **NPU Software-Hardware Co-Design**: Actively participated in hardware definition and architectural exploration to ensure optimal SW/HW alignment for power, performance, and area (PPA).
  - **MAC Architecture**: Evaluated trade-offs across MAC array size, SRAM bandwidth, PPE width, accumulator context size, and DSP instruction width.
  - **Dynamism Support**: Proposed and analyzed hardware support for dynamic shapes in transformers, enabling efficient MoE (Mixture of Experts) execution and flexible workload patching.
  - **Interconnect Design**: Defined tile interconnect strategies (unicast, multicast, broadcast) to balance latency, bandwidth, and scalability.
  - **Memory Hierarchy Design**: Contributed to memory subsystem design including size and placement of scratchpad SRAM, cache hierarchy, and DMA strategies.

Model Compression for NPU

Deep Learning software Engineer Intel 2018-Q4 - 2022-Q1

Responsible for developing model compression algorithms for NPU. Leading the adoption and integration of state of the art model compression techniques including low-bit quantization/unstructured pruning/AutoML/NAS.

- **Low-bit quantization**: Implementing state of the art model quantization techniques, including low-bit quantization methods like PACT and SAWB, Mixed precision methods including HAQ and HAWQ, Nonlinear quantization methods like log-based, outlier-aware and Squantizer.
- **Model pruning**: Implementing state of the art model pruning methods, including Sparse Momentum, Activation Map Compression, Auto Model Compression, Lottery Ticket and so on. Responsible for providing ultra compressed models for **MLPerf** inference, including **Resnet-50, Mobilenet, SSD-Mobilenet, SSD-Resnet34, Bert** and so on. Within 1% top-1 accuracy drop of **Resnet-50**, achieved 84% weight sparsity and 65% activation sparsity, resulting in >2× acceleration ratio compared to dense model.
- **AutoML**: Implementing reinforcement learning based methods for model compression and provide innovative ideas to better compress the models. Developed a channelwise Hessian aware trace weighted quantization method, which outperforms state of the art methods by around 1% top-1 accuracy.
- **Network architecture search**: Network architecture search on NPU for better utilization of Hardware performance. Developed super-resolution network that is 6x faster than **EDSR** with 7% better PSNR. Also

developed image classification network that is 10% faster than **Mobilenet-V2** with 5% better accuracy top-1.

Machine learning based Great Wall virtual repairing
Machine Learning Engineer Intel 2018-Q3 - 2018-Q4

- **Use Machine learning for Great Wall restore**
  - Cooperating with the Chinese Foundation for Cultural Heritage Conservation to launch an AI based method for its restoration.
  - Use 3D-GAN to obtain the basic structure of the original Great Wall. Then use linear regression to fit the generated 3D-model with higher resolution.
  - Expand the dimension of the brick images to include the structure-wise texture. Use GAN to generate the patterns of the missing part.

The Institute of Chinese Academy of Sciences
Post Graduate 2013-Q3 - 2018-Q2

- **Customized software design for proprietary WiFi chip**: Participated in the fabrication of two 802.11 chips, designed a customized MAC layer for the WiFi chip, and led WiFi authentication initiatives in accordance with the Ministry of Industry and Information Technology standards. Wrote the Linux driver from scratch for the WiFi chip and implemented the customized MAC layer.
- **Machine learning based SNR prediction**: Developed a machine learning-based method to enhance Signal-to-Noise Ratio (SNR) prediction in the MAC layer, resulting in a more than 20% improvement in overall throughput compared to the original method. Additionally, implemented model compression techniques on the LSTM model, achieving better power efficiency and reduced latency.
